The learning objectives of this chapter are: • To introduce the learner to the need to cool e diesel engine. • That the learner will know which diesel engine component and systems require cooling.

Marine Diesel Engine Cooling System

Cooling systems. The term cooling system in a water-cooled engine generally refers to a combination of the radiator, fan, thermostat, and the water pump which connect to passages in the engine and they are all designed to work in harmony to

A water-cooled cooling system. At the top of the cylinder head all the channels converge to a single outlet. A pump, driven by a pulley and belt from the crankshaft, drives hot coolant out of the engine to the radiator, which is a form of heat exchanger.

Unwanted heat is passed from the radiator into the air stream,...

The low coolant level in the radiator surge tank may be due to the fill process at the assembly plant, which cannot purge all of the air from the cooling system and the surge tank. After the

Diesel Engine Cooling System

The diesel engine (also known as a compression-ignition or CI engine), named after Rudolf Diesel, is an internal combustion engine in which ignition of the fuel which is injected into the combustion chamber is caused by the elevated temperature of the air in the cylinder due to the mechanical compression (adiabatic compression).
